

Cutting arborite sheets

I'm not robot!

What tool do you use to cut laminate sheets. Can you cut laminate sheets.

Home - Diy Arborite is an inexpensive and highly durable solution for countertops. Arborite is the stuff most of the countertops of the 1970's were made of, and many of those counters still exist in solid shape today, despite the fact that the older patterns are outdated. It's tough stuff, but in its inlaid form is terribly brittle and susceptible to chipping during cutting. Things You Will Need + Jigsaw or circular saw Plywood Masking tape Use a jigsaw or circular saw with a fine tooth blade. The smaller the tooth, the less likely you are to snag the brittle Arborite, rendering your cut useless. Where possible I recommend the jigsaw. Jigsaws give you the freedom of cutting your Arborite to fit things such as your sink hole perfectly. If you are cutting straight lines, however, a circular saw, or table saw will often do the job best. In either case, the saw blade choice is crucial to a clean cut without chipping. Use masking tape to true your straight lines for cutting. It will give the remaining Arborite a reason to separate from the masked area and it will give you an easy to follow line for your cuts. It's best to mask the printed side, as that is the piece most important to make chip free. Take the time to mask. Your new counter surface will thank you for your careful diligence through many years to come. The most important rule of thumb in working with power tools to complete a home renovation is this: If you rush the job, it will look like a rush job. The most important piece in the equation when cutting Arborite neatly, without chipping, is to lay it flat against a piece of plywood while cutting through the Arborite and the plywood. Learn how to cut and install laminate sheets yourself! Laminate sheets are easy to attach to plywood for a quick countertop solution! Laminate sheets are an inexpensive way to add a tough, waterproof surface to your countertops and table tops. I'll walk you through the process of how I laminated my Kreg workbench top so it can handle all the abuse from building, painting and sanding my woodworking projects. This post contains affiliate links for your convenience. Purchases made through these links may earn me a small commission at no additional cost to you. Please visit my disclosures page for more information. You may have seen this beat up top in some of my "in progress" photos. It's a material similar to whiteboard that I glued to an old door that serves as my workbench. I DO NOT recommend it for covering a work surface! I chose this material because it was really cheap (around \$15 for a 4'x8' sheet) and white shows up better for photos. While it worked out great for covering the dark wood paneled walls behind my lumber rack, it can't stand up to the abuse of building furniture every day! It shows every scratch and cut, and worst of all, it absorbs moisture and expands to create an uneven work surface. I got tired of editing out the worst spots in Photoshop, so it's time to give my workbench a makeover. Consider this a practice run for when I finally get tired of my contact paper kitchen countertops and install new laminate instead! Check out more DIY countertop ideas here! Materials Needed for Installing Laminate Sheets Don't forget your safety gear when woodworking! Here are my recommendations for safety glasses and ear protection. No excuses! How to Cut Laminate SheetsMeasure your countertop (and double check those measurements!) before you start cutting. You should add 1/2" to both the length and the width, which will be trimmed to size with a router later on.Score and Snap MethodIf you only need to make a few cuts, you can get away with using a utility knife and drywall square instead of a saw. Use the same score-and-snap method I used for cutting acrylic sheets.But using a saw is faster and results in a cleaner cut, so that's the method I used for cutting this laminate sheet to size.Power Saw MethodMark the ends of the cut line with a dry erase marker (it wipes off easily), then apply a strip of painter's tape from edge to edge along the cut line. This will prevent chipping on the finished surface. I forgot to do this, and there are tiny imperfections in the cut edge. Luckily, this is for my workshop, not a kitchen countertop!I decided to use a track saw instead of the table saw, since working with large sheets can be tricky in my small workshop. Use foam insulation panels to support the laminate sheet and prevent the blade from cutting through the workbench. Clamp everything down so it doesn't move as you cut.Start by cutting off the excess length. Line up the track or circular saw jig with the cut line, and carefully cut the laminate sheet down to size.Then cut the laminate sheet to the desired width. My workbench is just shy of two feet wide, so I was able to cut this piece down the middle and save the other half for when I inevitably destroy the first one!How to Install Laminate SheetsSand and Clean the SurfaceThe laminate sheet will show any imperfections in the surface below, so now is the time to give it a good sanding and cleaning. In my case, I just flipped my workbench top over to expose the original brown door with assorted paint splatters.Fill any holes and cracks with wood putty, then sand the surface smooth. This shallow cut from my early woodworking days went straight through the middle of the door! Oops! Remove any dust with a vacuum or tack cloth.Attach the edges firstIf this were a countertop, you would cut a strip of laminate to the thickness of the countertop and attach those first. Since this is a workbench and the old door has hinge cutouts and doorknob holes in the sides, I skipped this step.Contact cement is really stinky stuff, so make sure you work in a well ventilated area and follow all the safety instructions on the can. Stir the can to mix up any solids that may have sunk to the bottom. Then use that stir stick to scoop the contact cement onto the back of the laminate sheet.A foam paint roller helps to distribute the contact cement evenly over the surface quickly. Once you've coated the back of the laminate sheet, move it aside and apply contact cement to the countertop the same way.This part may seem counter intuitive, but you need to let both sides dry completely before attaching them together. It should take 10-15 minutes, and you can see the difference between the wet and dry sections pretty easily.Position the Laminate Sheet with DowelsOnce the two sides make contact, they're permanently bonded together (hence the name contact cement!) But it won't stick to anything else, so you can lay the sheet on top of wooden dowels and roll it around until you get it exactly where you want it!Space out the dowels every 8-12 inches along the countertop surface. I had these narrow rods in the workshop, but bigger ones like the center dowel would work better.Place the laminate sheet on top of the dowels, and roll them around to adjust the positioning until it overhangs slightly on all sides. Then pull out the center dowel and press down firmly.Work your way to the ends, pulling out the dowels and pressing the laminate down. Avoid creating air bubbles by pressing from the middle towards the open ends.Once the entire surface is covered, use a J-roller to apply firm pressure and create a strong bond.Whew! The nerve wracking part is over, and my workbench is already looking a million times better!Trim the Excess with a RouterIt would be nearly impossible to get the edges lined up perfectly, especially if this is your first time installing laminate. That's why I recommend you cut the sheet a little bit bigger than necessary and using a router to trim it exactly to size.Normally you would use a straight trim bit, but I already had a roundover bit in my trim router and I wanted to start using the workbench on my next project right away! I set the depth to 1/8", so it would only cut the laminate sheet.My laziness paid off! The curve of the roundover bit actually softened the sharp edge of the laminate just enough that I didn't need to file or sand it down at all. I would still recommend using a straight trim bit for a kitchen or bathroom countertop with two laminated edges that meet at a 90 degree angle, though.Sand or File the EdgesUse a file or sanding block to knock off any sharp corners or fuzzy underlayment left behind by the router bit.I can't believe I've put off this project for so long! It only took an hour or so to install this laminate sheet, and it looks sooooo much better now! Here's the before...and after!The laminate surface doesn't absorb wood glue and paint spills like the old one did, and it's much more resistant to scratches and scrapes.The smooth surface is also better for an outfeed table, when you want the wood to slide forward easily.Now I want to laminate all.the.things! I have plans to make a table saw stand with an extension on the side, and I'll be using the scrap laminate sheet from this project for the top. Stay tuned!

18/07/2022 · There looked like there should be room for another cubbie under the existing ones so I held my breath and started cutting.
